PROFESSIONAL SUMMARY

M.S. CS candidate at Georgia Tech (Computing Systems) with 7 years of professional experience debugging SDKs, APIs, and cloud platforms. Building toward systems software through low-level C++ architecture projects and graduate coursework in computer architecture, networks, and operating systems.

EDUCATION

Georgia Institute of Technology
M.S. Computer Science, Computing Systems Specialization. *Expected 2028*
Relevant Coursework: High-Performance Computer Architecture, Computer Networks, Graduate Intro to OS (planned), Advanced OS (planned), Graduate Algorithms (planned), GPU Hardware & Software (planned)

University of California, Santa Cruz
B.S. Computer Science: Computer Game Design. *May 2019*

SKILLS

Languages: C++, C#, JavaScript
Systems: Linux, Windows Server, computer architecture (cache hierarchies, memory systems), performance analysis
Frameworks & Engines: Node.js, .NET / ASP.NET Core, Unreal Engine, Unity, Google Apps Script, REST APIs
Cloud & Tools: Google Cloud Platform, Firebase, Git/GitHub, g++/Make, Google Gemini, GitHub Copilot, Claude

PROJECTS

Cache Hierarchy Emulator github.com/KindonSmith/cache_emulator May 2026 – Aug 2026
C++

- Built a five-stage series of C++ cache simulators (direct-mapped to two-level L1/L2) across 120+ commits; replays read/write traces with configurable cache parameters and write policies, reporting hit rates and AMAT.
- Validated the simulator against hand-derived hit-rate calculations for every documented experiment (cache size, associativity, write policy, block size); derived and simulated values matched exactly.
- Identified a 0% hit rate on a 1 KB L1 sized to fit a 40-block working set; traced the cause to accesses mapping to only half the sets via set-index bit analysis.
- Showed that 1-way associativity outperformed 4-way on a sequential trace (12.00 vs. 17.25-cycle AMAT), and that doubling block size cut AMAT from 17.25 to 9.12 cycles.

LoLSmith github.com/KindonSmith/LoLSmith In progress
C#, ASP.NET Core

- Built a REST API (ASP.NET Core 9, EF Core, SQLite) that ingests Riot Games API v5 match data into a normalized many-to-many schema, deduplicating matches shared across players.
- Implementing a token-bucket rate-limiting layer to keep requests within Riot API limits.

EXPERIENCE

Full Stack Developer (project assignment) Aug 2026 – Present
Accenture

- Develop across the full stack of a lab-study management app for a client (device inventory, participant booking, proctor management, calendar scheduling) in Google Apps Script (JavaScript) with a database, using Scrum.

Engineering Support Lead, Firebase Jul 2024 – Present
Accenture

- Lead a team of product support engineers for Firebase App Distribution and Firebase Test Lab.
- Drove adoption of Google Gemini-powered workflows, including full automation of the QASA case review workflow and an agent assistant tool, cutting average case time by about 20%.

Developer Support Engineer, Firebase Nov 2022 – Jul 2024
Accenture

- Debugged Firebase Cloud Messaging and REST API integrations; advised developers on Google Cloud Platform.
- Sustained a 95% case deflection rate over multiple years by simplifying processes and improving developer self-service resources.

Cloud Support Engineer, Stadia Oct 2019 – Oct 2022
Accenture

- Investigated SDK, API, and shader compilation issues in partnership with engineering, turning root-cause findings into clear, actionable guidance for external game studios.
- Served as primary technical contact for game studio partners; sustained 85% deflection rate and 4.94/5 CSAT (team average: 4.86/5).
